PROFILE

Full Stack Developer trained at UTN. I build web applications end to end with React, TypeScript, Node.js, Express, PHP and Laravel, on relational and non-relational databases: REST API design, data modeling, authentication, security and deployment. I work as a freelancer for clients in Argentina, Chile and Spain, with a 5.0 rating on Workana, including production systems for an industrial plant and an online store with live traffic. I care about maintainable code, performance and interfaces that explain themselves.

EXPERIENCE

Freelance Full Stack Developer

2026 - PRESENT

Workana · clients in Chile and Spain · 5.0 rating

- **Real-time collaborative platform (Chile):** editor where several people design an event layout together, synced through a custom CRDT over WebSocket, with PNG and PDF export. TypeScript, React, Node.js and PostgreSQL.
- **Production API security (Spain):** security audit and access control for the Laravel API used by an industrial plant: API-key authentication, web vulnerability fixes and an injection review, rolled out without interrupting operations.
- **Multi-device hub for industrial scales (Spain):** Laravel backend and admin panel to manage several scales from one hub, with code-based enrollment, per-device authentication through Sanctum and weighing history stored on the server. The scale app is an offline-capable PWA, in production.
- End-to-end ownership of every project: scoping with the client, development, testing, rollout and maintenance.

Independent Web Developer

2026 - PRESENT

Eugenia Quevedo, Official Store · eugeniaquevedo.com

- Development and customization of the singer's official online store on Tiendanube, with a custom theme built from scratch in Twig, HTML, CSS and JavaScript.
- Front-end performance and responsive layout work (image optimization, render-blocking asset reduction and mobile-first breakpoints) on a live store with real traffic and active sales campaigns.
- UX improvements across product, cart and checkout, plus cross-browser and accessibility fixes.
- Ongoing maintenance and improvements released directly to production, coordinated with the client.

PROJECTS

Workflow TypeScript · React · Node.js · Express · PostgreSQL · Stripe

workflow-saas-8006.onrender.com

Multi-tenant task management SaaS. Several companies share one database without seeing each other's data, four roles set each member's permissions, plan limits are enforced on the server and billing runs on Stripe webhooks with verified HMAC signatures.

Slate TypeScript · React · Node.js · WebSocket · PostgreSQL · CRDT

coedit-a0jk.onrender.com

Real-time collaborative whiteboard and text editor. Three CRDTs written from scratch, with no sync libraries, so concurrent edits never conflict, survive going offline and converge to the same state, with convergence verified by an automated test suite.

FrameBox React · Express · MongoDB · MySQL · JWT

Final Capstone Project, UTN

Personal film library on a layered architecture (routes, controllers, services, repositories) with a REST API. Each user builds a collection, sorts it by status and genre, rates titles and marks favorites. bcrypt hashing, JWT with expiration, protected routes and email verification through Nodemailer.

Weather Dashboard JavaScript · SVG · Canvas · Open-Meteo

weather-app-santiago.vercel.app

Real-time weather app built around the day's temperature curve drawn in SVG, with rain and snow animated on Canvas, an air-quality index, geolocation and five languages.

Personal Portfolio HTML5 · CSS3 · JavaScript · Matter.js

santiagohermosilla.com

Framework-free site with dark and light themes validated against WCAG AA contrast, Spanish and English versions, semantic markup with structured data for SEO and an interactive mode with a 2D physics engine that only loads when used.
